ACKNOWLEDGEMENTS

The Yemen Ministry of Public Health and Population (MoPHP) / Rayma Governorate Public Health and Population Office, in collaboration with UNICEF Yemen Country Office and the Yemen Nutrition Cluster, and in support of Hodeidah Governorate Public Health and Population Office acknowledge the contribution of the various stakeholders in this survey.

The UNICEF Yemen Country Office provided technical support employing SMART methodology. A survey manager and supervisors were provided by the Taiz Governorate Health and Population Office, MoPHP, and Hodeidah Governorate Health and Population Office. The survey enumerators and team leaders came from governorates of Rayma, Taiz and Hodeidah. The data entry team from the Office of Hajja Governorate Public Health and Population and from the Ministry in Sana'a performed the data entry to enable daily data quality verification.

The Rayma Governorate Public Health and Population Office with support from Hodeidah Governorate Public Health and Population Office oversaw the political and logistical arrangements for the survey, ensuring its smooth operation. The Nutrition survey was supported financially by UNICEF under a grant from the European Commission for Humanitarian Aid and Civil Protection (ECHO); this support is greatly appreciated. The contribution of local authorities in ensuring the survey teams' security during fieldwork and in providing office facilities is gratefully appreciated.

The data could not have been obtained without the co-operation and support of the communities assessed, especially the mothers and caretakers who took time off from their busy schedules to respond to the interviewers. Their involvement and cooperation is highly appreciated.

UNICEF and MoPHP also express their sincere appreciation to the entire assessment team for the high level of commitment and diligence demonstrated during all stages of the assessment to ensure high quality of data collected, and the successful accomplishment of the exercise.

EXECUTIVE SUMMARY

Between 26 and 31 May 2012, MoPHP and Rayma Governorate Public Health and Population Office supported by UNICEF conducted nutrition and mortality survey in Rayma Governorate using the Standardized Monitoring and Assessment for Relief and Transition (SMART) methodology to establish and monitor the levels of acute malnutrition, stunting and underweight among children aged 6-59 months, identify some of the factors associated with malnutrition, estimate the underfive and crude death rates, and inform on the appropriate responses.

Using a two-stage Probability Proportionate to Population Size (PPS) sampling methodology, 30 clusters were randomly selected for both anthropometric and mortality assessments. A minimum of 18 households per cluster were randomly selected and assessed. However, one cluster was left for access difficulties. A total of 522 households were surveyed, covering a total of 640 children aged 6-59 months, respectively.

Results indicate that GAM rate using WHZ Scores is above the WHO 'serious' threshold with 10.8 per cent, however, proxy GAM using MUAC cutoff point of 125 mm is 13.1 per cent which is considered 'critical' as per the categorization of UNFAO/Food Security and Nutrition Analysis Unit (FSNAU). With high levels of proxy GAM, and stunting rates of 71.4 per cent and underweight of 50.4 per cent, it is highly probable that Rayma Governorate is suffering from chronic food insecurity. Beyond nutritional indicators above, high level of morbidity is also reported by this survey with levels of 48.1 per cent diarrhoea, 43.6 per cent ARI and 54.8 per cent fever.

The main sources of drinking water for about 70 per cent of households are protected springs, unprotected surface water, and unprotected open wells. Only 67 per cent of households seek health services from a public health facility when sick. Vitamin A coverage is lower than the Sphere Standards recommendation of 95 per cent coverage (83.1 per cent). About 80 per cent the children aged 6-24 months do not receive the recommend four meals a day.

There is effect on the nutritional status have been seen for breastfeeding continuity after the 6th month, diarrhoea and ARI prevalence, cleanness of drinking water storage, latrine type, handwashing after toilet and before and after meal, and the education level of household caretaker.

Crude death rate found is 0.17 per 10000 per day, while underfive death rate is 0.31 per 10000 per day.

Specific recommendations include:

Immediate Interventions

- The priority is cleaning the pockets from acute malnourished by mobilizing outreach clinics and to refer the complicated cases to nearest TFCs. Outreach clinics should also provide treatment services for child illnesses especially diarrhoea and ARI.

Medium and Long Term Interventions

- Rayma is in need of a programme that deals with underweight and chronic malnutrition. This should include utilization the approach of Growth Monitoring and

Promotion (GMP), maternal nutrition package, and promotion of hygienic. Pregnant women, lactating mothers, and underweight children should be supported by rations cereal: legume mix (locally known *Shabiza*) with sachets of micronutrients sprinkles in monthly basis.

- Food security enhancement projects are also required for Rayma, since this governorate is suffering from chronic food insecurity that can be seen from the high level of stunting, high levels of proxy GAM and from the high insecurity prevalence as mentioned earlier and average maternal MUAC as shown by the WFP - CFSS 2011. Rayma is the lowest governorate of average maternal MUAC with value of 24.2 cm.

Other Recommendations

- Rayma is the first governorate that was found to have higher proxy GAM and SAM by MUAC cutoffs than standard GAM and SAM by WH Z-scores. However, there could be other governorates with the same pattern that are suffering from chronic food insecurity, higher rates of stunting and underweight. For such cases, the international expertise is needed to setup intervention packages that are definitely beyond the idea of just having CMAM services.

Table 1. Summary of Nutrition Survey in Rayma Governorate, May 2012			
Indicator	N	%	95% CI
Child Malnutrition			
Total number of households assessed for children*	522	100	
Mean household size	6.9		
Total number of children assessed	638/640	99.7	
Child sex: Males (boys)	329	51.4	
Females (girls)	311	48.6	
Global Acute Malnutrition (WHZ<-2 z-score or oedema)	68	10.8	8.5 - 13.5
Severe Acute Malnutrition (WHZ<-3 z score or oedema)	9	1.4	0.7 - 2.8
Oedema	0	0	
Chronic Malnutrition (H/A<-2 z score)	439	71.4	67.6 - 74.9
Severe Chronic Malnutrition (H/A<-3 Z score)	254	41.3	37.4 - 45.3
Underweight prevalence (W/A<-2 Z score)	320	50.4	46.4 - 54.3
Severe Underweight (W/A<-3 z score)	120	18.9	16 - 22.2
Child Morbidity			
Children reported with suspected measles within one month prior to assessment	16	2.5	1.5 - 4.1
Children reported with diarrhoea in 2 weeks prior to assessment	308	48.1	44.2 - 52.1
Children reported with ARI within two weeks prior to assessment	279	43.6	39.7 - 47.5
Children reported with febrile illness in 2 weeks prior to assessment	351	54.8	50.9 - 58.7
Immunization and Supplementation Status			
Children aged 9 - 59 months immunised against measles	532	92.4	89.8 - 94.3
Children who have received 3 doses of polio vaccine (routine)	482	76.9	73.3 - 80.1
Children reported to have received vitamin A supplementation in last 6 months	520	83.1	79.8 - 85.9
Child Feeding			
Children (6-24 months) reported to be breastfeeding	136	62.7	55.9 - 69.1
Children (6-24 months) fed 4 times and above	44	20.3	15.1 - 26.2
Mortality			
0-5 Death Rate (U5DR) as deaths/10,000/ day	0.31		0.07 - 1.27
Crude Death Rate (CDR) as deaths/10,000/ day	0.17		0.08 - 0.37

1.0 INTRODUCTION / BACKGROUND

Rayma is the most newly created governorate in Yemen, which was part of Sana'a Governorate up to 2004. It is located 200 Km from Sana'a city, bordered by governorates of Hodeidah, Dhamar and Sana'a, with population size of about 500,000 that represents 3 per cent of the country population.

Administratively, Rayma is composed from 6 districts, AlJabeen (the Capital), AlJafaria, AlSalafia, Mazhar, Kusma, and Belad Al-Ta'am.

Rayma is characterized by rugged nature and high mountains, located amid a series western mountains between the degrees of 14.36 - 14.88 north and 43.50 - 44 east. Topographically, it contains a group of the highest Tihama highland chains, the western part of mountains of altitude ranged 1600 to 1800 metres above the sea level, the middle part of mountains of altitude ranged 1500 to 2950 metres above the sea level, and the eastern part with mountains of lower altitudes interspersed with valleys

The climate is characterized by coldness in winter and moderateness in the summer.

Agriculture in forms of cultivation of fruits, vegetables, cereals and coffee as well as breeding animals and honey production are the main activities practiced by people there.

Based on WFP-CFSS 2009, Rayma was at the top of governorates for the percentage of poor food consumption (24.3 per cent) and percentage of population with food in security (52.8 per cent).

Rayma is also the highest of having malnutrition among women aged 15 to 49 years with 26.8 per cent of women with MUAC below 21.4 cm and 39.8 per cent of women with MUAC below 22.2 cm.

The 2011 WFP-CFSS survey reported the moderate and severe food insecurity of 50.6 per cent that is close the one of 2009 estimating that 242,268 of the governorate population are food insecure. CFSS also report prevalence of acute malnutrition of 8.9 per cent with severe type of 2.8 per cent, chronic malnutrition of 68.4 per cent with severe type of 39.2, and underweight of 45.2 per cent with severe type of 16.8 per cent.

The CFSS survey shows that 35.1 per cent of household heads (mostly man) are illiterate and 21.9 per cent can read and write but had not enrolled in formal school education, while the 75.3 per cent of spouses (mostly woman) are illiterate and 9.8 per cent can read and write.

Health services are provided through 109 health facilities (2 hospitals, 35 health centres, and 72 health units). Nutrition CMAM services are provided by only 6 facilities. The routine coverage of vaccination is low with percentages of 25 per cent for pentavalent 3 and 23 per cent for measles.

Figure (1): Map of Rayma Governorate

2.0 ASSESSMENT OBJECTIVES

The overall objective of the survey was to establish the nutrition situation in Rayma Governorate, determine some of the factors influencing malnutrition, and identify some of the public health services accessible to the population.

Specific objectives:

1. To estimate the level of acute malnutrition (wasting), stunting and underweight among children aged 6-59 months in Rayma Governorate.
2. To identify factors influencing nutrition status of the children including disease prevalence and access to essential services in the governorate.
3. To estimate the prevalence of some common diseases (measles, diarrhoea, fever and ARI) in the governorate.
4. To estimate the measles and polio vaccination and Vitamin A supplementation coverage among children in the governorate.
5. To estimate the crude and under-five mortality/death rates in the governorate.

3.0 METHODOLOGY

3.1: Sampling Design and Sample Size Determination

A cross-sectional survey was conducted between 26 and 31 May 2012 in Rayma Governorate. Using a two-stage Probability Proportionate to Population Size (PPS) sampling methodology, 30 clusters were randomly selected for the survey. The cluster sampling methodology was selected in view of lack of an exhaustive updated list of household details. The total estimated population was 501166 (Ref: Annex 8: Sampling Frame: Source: CSO Projection of 2004 Census).

A sample size of 517 households was calculated using ENA for SMART software based on the estimated parameters shown in Table 2. The calculated sample size for mortality

Parameters	
Estimated Acute Malnutrition Prevalence (%) ¹	20.1
Desired Precision (%)	5
Design Effect ²	2
Average Household Size ³	7
Under 5 year old (%) ⁴	17
Non response household (%) ⁵	3
Sample Size (N)	517

was about 487 households, hence the sample calculated for anthropometry was considered for mortality as well.

A minimum of 18 households per cluster were recommended for assessing the anthropometry and mortality. A total of 522 households were surveyed in 29 clusters while one cluster could not be reached,

reaching a total number of 640 children aged 6-59 months, respectively.

3.2: Sampling Procedure

The ENA for SMART software was used in the random selection of the 30 clusters from the sampling frame, including identification of the reserve clusters. The sampling frame consisted of an exhaustive list of villages and the estimated population size for each. In this case, all villages were accessible and were included in the sampling frame, thus giving them an equal chance of being selected.

Only 29 out of the 30 clusters randomly selected were accessible and assessed. One cluster was unreachable for geographical difficulties after more than 18 hours of traveling by car and walking. The reserve clusters were not assessed in the survey since the lost is less than 10 per cent of the total clusters. Upon reaching the cluster, the survey teams, with the help of an elder or the guide, requested the residents' permission to assess the areas. The purpose of the survey was explained and the

¹ International Food Policy Research Institute/Ministry of Planning and International Cooperation: National Food Security Paper, Feb 2010: Page 105 for GAM in Rayma.

² Minor heterogeneity within clusters in the study population explored based on presence of "marginalized groups"/ non-integrated groups, differences in infrastructural network hence access to services and information, rain dependence vs irrigation farming, livelihood (*Qat* growers vs *Qat* sellers, and farming, etc)

³ Calculated on basis of Central Statistics office data of population versus households

⁴ Estimated on basis of MoH reports and immunization statistics

⁵ Non-response rate of 3% was estimated in case the teams encounter refusal, security-related inaccessibility or absence.

process of random selection of a representative sample from the cluster was also elaborated.

Once granted permission to continue with the survey, the survey team used the Modified EPI methodology to randomly pick the household to be interviewed. This involved identifying the centre of the cluster, where they had to spin a pen to randomly select the direction to take to the edge of the settlement. The team walked to the edge of the cluster. From the edge, the team had to spin the pen again aiming to randomly get a direction to follow to the other extreme edge of the settlement. In case the pen pointed towards outside of the settlement, the teams were to spin the pen multiple times till the pen pointed to any of the directions towards the settlement. Once a new direction was obtained, the team counted all the households along the randomly selected direction, gave each household a number, and then randomly selected the first household to be interviewed from the numbered households (for example, household number 7 in the households numbered 1 to 10, in the figure (2)).

Figure (2): The modified EPI method used for selection of households

Same direction was followed to select the subsequent household for interview, going for next nearest household on the right side and following the selected direction, until the required minimum number of households and children had been assessed (Ref: Figure (2) indicating the household selection process- Figure adopted from the SMART Methodology Guideline).

Anthropometric data alongside other child data were collected from all children aged 6-59 months found in the randomly selected household. However for villages of relatively low counted numbers of households, every household is given a number, then the total number of the requested sample is drawn randomly.

In case the team assessed all households to the edge of the cluster and did not reach the required number of households, the team would repeat the process again i.e. start from the cluster/ village centre to randomly select another direction, then walk to the edge, then spin the pen again and count the households to the edge of the cluster. Then randomly pick the first household for interview, and then go the next nearest household, to the right hand side, till the required number of households were interviewed.

In case of absence of the children during the interview time or absence of the members of the randomly selected households, an appointment was made by the survey team to return back before leaving the cluster.

3.3: Study Population and Data Collection Process

As defined in the sampling frame, the study population was the entire population of Rayma Governorate as found from different resources.

The activities undertaken in the entire survey period are summarised in Table 3, below. Data collection preparation commenced with a four-day training of enumerators, team leaders and supervisors (Ref: Annex 3: Rayma Nutrition Survey Team). The training

conducted covered interview techniques, sampling procedures, field procedures (random household selection, introduction and systematic data collection), inclusion and exclusion criteria, sources and reduction of errors, taking of measurements (height, weight and MUAC) focusing on achieving high precision and accuracy, data collection standardisation procedures to ensure data quality, diagnosis of oedema, measles, ARI, diarrhoea and collection of household details necessary to establish household members movement and/or death in order to compute mortality rates, handling of equipment and the general courtesy during the assessment. Six survey teams were involved in the data collection process.

Quantitative data were collected by means of a household questionnaire for nutrition survey and a mortality survey question, adopted from the SMART Methodology guidelines (Ref: Annex 1: Rayma Nutrition Survey Questionnaire and Annex 2: Rayma Mortality Survey Questionnaire). Only children aged 6-59 month or with length/ height of 65 - 109.9 cm were included in the anthropometric assessment. The age estimation was based on birth or immunization card details and/or supported with events calendar and date conversion tables based on the Islamic Calendar (Ref: Annexes 5 and 6: Age Conversion Tables and Events Calendar).

Retrospective mortality data were collected from all randomly selected households, irrespective of presence or absence of children aged 6-59 months. A recall period of 90 days prior to the survey was used.

Table 3: Chronology of activities in the survey

Action	Period
Preparation: Contacting local authority, survey team identification, training material preparation	21 - 26 Apr
Training of survey teams and field test	28 Apr - 3 May
Data collection and data entry	26 May - 2 June
Data cleaning and analysis	11 - 13 June
Report drafting and releasing	14 - 22 June
Circulation of final report	30 June

3.4: Measurement Standardization and Quality Control

Six survey teams underwent rigorous standardisation test procedures using 10 children aged 6 - 59 months. This exercise was conducted at the training place in Women Union place in Hodeidah City and it aimed at assessing the accuracy and precision of the survey teams for purposes of enhancing the survey data quality. The weak team members were identified and the common mistakes made were identified and addressed (Ref: Annex 4: Rayma Nutrition Survey Standardization Test Report, showing team performance and how errors were rectified/ addressed). Further field testing of survey tools and exercise on data collection, including household selection and interview steps and familiarization of questions was conducted, and field level challenges and common mistakes identified and discussed. The field testing was conducted in Tabbat Al-Shawesh village in AlJabeen District. This village was not one of the randomly selected clusters.

Each team was composed from 3 female surveyors and one male team head. Two out of

the three female surveyors are recruited from those have participated in surveys conducted in Hodeidah and Taiz while the third member is from Rayma Governorate.

Beside training, which also included role playing and field testing, data quality was also ensured through (i) Monitoring of fieldwork by coordination team; (ii) Crosschecking of filled questionnaires on a daily basis, recording of observations and daily de-briefing and discussion; (iii) Confirmation of measles, severe malnutrition especially oedema cases and death cases by supervisors; (iv) Daily entry of anthropometric data, continuous data cleaning and plausibility checks, plus ensuring each team was given feedback on the quality of previous day's data before the start of a new day; (v) Equipment calibration/ monitoring accuracy of equipment (weighing scales) by regularly measuring objects of known weights to check for any differences, (vi) Additional check was done at the data entry level to enable entry only of relevant possible responses and measurements; (vii) Continuous reinforcement of good practices. During the field data collection, all measurements were loudly called by both the enumerators reading and recording them, to reduce errors during recording.

Clear job descriptions were provided to the teams as part of the training, to ensure appropriate guidance in delivering the assigned tasks (Annex 9: Survey Team Job Description). The supervisor had to review the questionnaire and verify the accuracy of the details before the teams leave a household, thus minimizing possibility of incomplete data (missing variables) and outliers.

3.5: Data Entry and Analysis

The anthropometric data were entered and analysed using ENA for SMART software, while the remaining household variables and child-related variables (feeding practices and morbidity) were entered and analysed using Epi info version 3.5.3. Running and tabulation of all variable frequencies was carried out as part of data cleaning. The nutrition indices (z-scores) for Weight for Height (wasting), Height for Age (stunting) and Weight for Age (underweight) were generated and compared with WHO 2006 Growth Standards. Children/cases with extreme z-score values were flagged and investigated and appropriately excluded in the final analysis if deviating from the observed mean (SMART flags).

The classification used for wasting levels was a follows:

- W/H < -3 Z-Scores or oedema = Severe acute malnutrition
- W/H \geq -3 Z-Scores < -2 Z-Scores = Moderate acute malnutrition
- W/H < -2 Z-score or oedema = Global/total acute malnutrition
- W/H \geq -2Z-Scores = Normal

The classification used for proxy wasting levels using MUAC was a follows:

- MUAC < 115 mm or oedema = Proxy severe acute malnutrition
- MUAC \geq 115 mm < 125 mm = Proxy moderate acute malnutrition
- MUAC < 125 mm or oedema = Proxy global/total acute malnutrition
- MUAC \geq 125 mm = Normal

The classification used for Stunting levels was a follows:

- H/A < -3 Z-Scores = Severe stunting
- H/A \geq -3 Z-Scores < -2 Z-Scores = Moderate stunting
- H/A < -2 Z-score = Stunting Prevalence rates
- H/A \geq -2Z-Scores = Normal

The classification used for Underweight levels was a follows:

W/A < -3 Z-Scores = Severe Underweight
W/A \geq -3 Z-Scores < -2 Z-Scores = Moderate underweight
W/A < -2 Z-score = Underweight Prevalence Rates
W/A \geq -2Z-Scores = Normal

Frequencies and cross-tabulations were used to give percentages, means and standard deviations in the descriptive analysis and presentation of general household and child characteristics.

Mortality data were entered and analysed using the ENA for SMART software.

3.6: Data Entry Verification and Cleaning

Team of Two members shared the work of data entry, and then each member would review the work done by another colleague before merging the data on a daily basis.

About 10 per cent of the entered questionnaires were randomly drawn using the Random Number Table of ENA software. These drawn questionnaires were revised for accuracy of entry in the electronic database. The quality of data entry was accepted if accuracy was not less than 95 per cent.

The uniqueness of IDs of both household questionnaire and mortality sheet was also reviewed for any repeating during data entry.

For anthropometry data, all flagged records were also reviewed by means of revisiting original questionnaires.

4.0 ASSESSMENT RESULTS

4.1: Household Characteristics of Study Population

As shown in Table 4 below, the gender of household head in more than 90 per cent of households is male. 81 per cent of household heads are married and living with partner. About two thirds of household caretakers in the survey area are illiterate while the proportion of household caretakers with basic, secondary and higher education is collectively 7.4 per cent.

The three main income sources for households are temporary work (casual labour)⁶, fixed monthly waged work and remittance with total percentage of about 69.3 per cent as shown in Table 4.

Regarding drinking water, the main three sources for about 70 per cent of households are protected springs, unprotected surface water, and unprotected open wells. Only 3.6 per cent of households do treatment for drinking water mainly by filtration. About 54 per cent of the households store drinking water in clean containers (algae growth is not seen).

As shown in Table 4, only 29.5 per cent use flush or pour flush latrine system while 45.5 per cent use either open pit latrine or simple covered pit latrine in their human waste disposal. About one quarter of households defecate in open.

Table 4: Household Characteristics		
	N	%
Total Households	522	100
Household size (Mean):	6.9	
Mean No of Under-fives	1.37	
Mean No of 6 - 59 months	1.23	
<i>Sex of Household Head:</i>		
Male	476	91.2

1. Illiterate	316	60.5
2. Read and write	112	21.5
3. Basic education	48	9.2
4. Secondary education	23	4.4
5. Higher education	23	4.4
<i>Main Source of Income:</i>		
1. Temporary work/ Casual labour	191	36.7
2. Fixed monthly waged work	109	20.9
3. Remittance	61	11.7
4. <i>Qat</i> cultivation and trade	47	9.0
5. Donations from friends and relatives	32	6.1
6. Trade	22	4.2
7. Crops other than <i>Qat</i>	20	3.8
8. craftsmanship	17	3.3
9. Animals and animal products	12	2.3

⁶ Temporary work is daily wage based work such as work in construction, on others' farms, etc.

	<i>N</i>	%
10. Social assurance	6	1.2
11. Other	4	0.8
<i>Main water source for drinking</i>		
1. Water from protected spring	199	38.1
2. Unprotected surface water (wadi, springs, etc)	99	19.0
3. Water from unprotected open well	67	12.8
4. Water from covered rainwater harvesting tank	55	10.5
5. Water from protected open well	53	10.2
6. Water from uncovered rainwater harvesting tank	25	4.8
7. House-connected yard piped water	15	2.9
8. Water tanker	8	1.5
9. House-connected piped water	1	0.2
<i>Household latrine type</i>		
1. Flush/pour flush latrine	154	29.5
2. Open pit latrine	137	26.2
3. Simple covered pit latrine	101	19.3
4. Defecation in open (in fields, etc.)	129	24.7
5. Other	1	0.2

4.2: Morbidity, Immunization Status and Health Seeking Behaviour

High prevalence of common diseases was recorded as reflected in Table 5 below. During the two weeks prior to the survey, recorded prevalence of diarrhoea among children was 48.2 per cent, the prevalence of ARI as described by coughing or breathing difficulty was 43.6 per cent and the prevalence of fever two weeks prior to the survey was 45.8 per cent. Suspected measles⁷ during the last month was 2.5 per cent.

As shown in Table 5, the coverage for routine polio vaccination is low with proportion of 76.9 per cent that is also joins the three doses of pentavalent vaccination, while it is 92.4 per cent for measles immunization coverage mostly through outreach campaigns. During the previous 6 months, 83.1 per cent of the children had received vitamin A supplements. The above immunization coverage and vitamin A supplementation coverage are lower than the Sphere Standards recommended 95 per cent coverage.

Only 8.6 per cent of surveyed children slept under a mosquito net the night before the survey.

	<i>N</i>	%
<i>Where health service is sought</i>		
Public health facility	347	66.5
Private clinic	64	12.3
Pharmacy	23	4.4
Personal medication	64	12.3
Traditional medication	4	0.8
Do not seek medical assistance	20	3.8
<i>Morbidity</i>		
Proportion of children with diarrhoea within 2 weeks prior to assessment	308	48.2
Proportion of children with ARI within two weeks prior to assessment	279	43.6
Proportion of children with fever within two weeks prior to assessment	351	54.8

⁷ The suspected measles is defined as having rash and fever in addition to at least one of: cough, sore throat, or conjunctivitis.

	<i>N</i>	<i>%</i>
Suspected measles within one month prior to assessment	16	2.5
<i>Immunization</i>		
Children (9-59 months) immunised against measles	532	92.4
Children who have received the routine polio vaccine	482	76.9
<i>Supplementation</i>		
Children who received vitamin A supplementation in last 6 months	520	83.1
<i>Sleeping under mosquito net</i>		
Children slept under mosquito net last night	55	8.6

As shown in Table 5, only 66.5 per cent of households seek health services from public health facilities, while 16.9 per cent are either practice personal or traditional medication or do not seek medical assistance. Far distant and high cost of the service is the main two reasons said by those where not seeking the service.

4.3: Feeding Practices

	<i>N</i>	<i>%</i>
<i>Still breastfeeding</i>	136	62.7
<i>Number of feeds (other than breastfeeds)</i>		
No feed	20	9.2
One feed	20	9.2
Two feeds	34	15.7
Three feeds	99	45.6
Feeding 4 times and above	44	20.3
<i>Number of milk feeds (other than breastmilk)</i>		
No milk feed	58	27.8
One milk feed	24	11.5
More than one milk feed	127	60.8

As shown in Table 6, only 62.7 per cent of children aged 6 to 24 months are continuing breastfeeding. Additionally, only 20.3 per cent of this category of children had 4 and above feeds other than breastfeeding in the previous day. Inappropriate infant and young child feeding practice of giving milk (other than breastmilk) to children over 6

months of age was recorded as common in Rayma with percentages of 72.3 per cent of children in the previous day to the survey.

4.4: Characteristics of the children assessed

<i>AGE (mo)</i>	<i>Boys</i>		<i>Girls</i>		<i>Total</i>		<i>Ratio</i>
	<i>no.</i>	<i>%</i>	<i>no.</i>	<i>%</i>	<i>no.</i>	<i>%</i>	<i>Boy:girl</i>
6-17	74	50.0	74	50.0	148	23.1	1.0
18-29	67	47.9	73	52.1	140	21.9	0.9
30-41	85	48.9	89	51.1	174	27.2	1.0
42-53	78	57.4	58	42.6	136	21.3	1.3
54-59	25	59.5	17	40.5	42	6.6	1.5
Total	329	51.4	311	48.6	640	100.0	1.1

Generally there were more boys than girls assessed in this survey, as shown in table 7, however, the difference is not statistically high ($p=0.477$) as found by the plausibility check of the survey date (Annex 11: Assessment Quality Check)

4.5: Nutrition Status

Below is a summary of the anthropometric results of the nutrition survey. Data quality was validated using the Plausibility check function of the SMART for ENA software. The overall scoring of the plausibility check of the survey data is 11 which is categorised as

acceptable (Ref: Annex 11 for the Assessment Quality Check)

4.5.1: Acute Malnutrition Rates

Though there is an overall shift to the left of the study population when compared with the reference population, as per the graphs shown (implying presence of malnutrition). The interpretation was made based on the 2006 WHO Growth Standards.

The level of wasting with oedema – also known as global acute malnutrition (GAM) – found is **10.8 per cent**, which classifies as ‘serious’ as per the WHO categorization of the severity as shown in Tables 8 (including the confidence intervals).

Pockets of high nutritional vulnerability in some clusters were noted and reported (P=0.000). Levels of severe acute malnutrition (SAM) of 1.4 per cent and moderate acute malnutrition (MAM) of 9.4 per cent are lower than the national levels as well as rates estimated by IFPRI for Rayma based on HBS 2005-06 data (12.6 per cent MAM and 7.5 per cent SAM), however these levels are close to those found by WFP-CFSS 2011 that are 8.9 per cent GAM and 2.8 per cent SAM. There was no oedema case identified by the survey.

	All n = 630	Boys n = 325	Girls n = 305
Prevalence of global malnutrition (<-2 z-score and/or oedema)	(68) 10.8 % (8.5 - 13.5 95% CI)	(40) 12.3 % (9.0 - 16.5 95% CI)	(28) 9.2 % (6.3 - 13.1 95% CI)
Prevalence of moderate malnutrition (<-2 z-score and >=-3 z-score)	(59) 9.4 % (7.3 - 12.0 95% CI)	(36) 11.1 % (8.0 - 15.1 95% CI)	(23) 7.5 % (4.2 - 13.3 95% CI)
Prevalence of severe malnutrition (<-3 z-score and/or oedema)	(9) 1.4 % (0.7 - 2.8 95% CI)	(4) 1.2 % (0.4 - 3.3 95% CI)	(5) 1.6 % (0.6 - 4.5 95% CI)

The prevalence of oedema is 0.0 per cent

However, the image for Rayma is different when MUAC cut offs of 115 mm and 125 mm are used to estimate proxy GAM and proxy SAM. The table 9 below indicate that proxy GAM is high as 13.1 per cent and proxy SAM is high as 3 per cent which classifies as ‘critical’ as per FAO categorization when MUAC is used.

The prevalence of acute malnutrition based on the NCHS reference is reflected the summary of Table 12, below.

	<i>All</i> <i>n = 639</i>	<i>Boys</i> <i>n = 329</i>	<i>Girls</i> <i>n = 310</i>
Prevalence of global malnutrition (< 125 mm and/or oedema)	(84) 13.1 % (9.8 - 17.5 95% CI)	(37) 11.2 % (7.5 - 16.6 95% CI)	(47) 15.2 % (10.6 - 21.1 95% CI)
Prevalence of moderate malnutrition (< 125 mm and >= 115 mm, no oedema)	(65) 10.2 % (7.6 - 13.5 95% CI)	(28) 8.5 % (6.0 - 12.0 95% CI)	(37) 11.9 % (8.1 - 17.3 95% CI)
Prevalence of severe malnutrition (< 115 mm and/or oedema)	(19) 3.0 % (1.8 - 4.9 95% CI)	(9) 2.7 % (1.2 - 6.3 95% CI)	(10) 3.2 % (1.7 - 5.9 95% CI)

4.5.2: Chronic Malnutrition Rates

As mentioned above, stunting prevalence in Rayma is the highest that has not ever been seen in other governorates with a level of 71.4 per cent as shown in Table 10. There is an overall shift to the left of the study population deviating from the reference population. The prevalence of severe stunting is also high with rates of 41.3 per cent. The statistical details of the stunting rates are as shown in the table 10 below.

This stunting level exceeds the 40 per cent threshold for critical levels according to WHO (2000), hence the situation is of great concern. It is higher than the estimated by IFPRI (overall stunting of 60.1 per cent and severe stunting of 41.5 per cent), but close to findings of the WFP-CFSS 2011 (overall stunting of 68.4 per cent and severe stunting of 39.2 per cent).

	<i>All</i> <i>n = 615</i>	<i>Boys</i> <i>n = 321</i>	<i>Girls</i> <i>n = 294</i>
Prevalence of stunting (H/A < -2 z-score)	(439) 71.4 % (67.6 - 74.9 95% CI)	(236) 73.5 % (68.3 - 78.3 95% CI)	(203) 69.0 % (63.4 - 74.3 95% CI)
Prevalence of moderate stunting (< -2 z-score and >= -3 z-score)	(185) 30.1 % (26.5 - 33.9 95% CI)	(99) 30.8 % (25.9 - 36.3 95% CI)	(86) 29.3 % (24.1 - 34.8 95% CI)
Prevalence of severe stunting (H/A < -3 z-score)	(254) 41.3 % (37.4 - 45.3 95% CI)	(137) 42.7 % (37.2 - 48.3 95% CI)	(117) 39.8 % (34.2 - 45.6 95% CI)

4.5.3: Underweight Rates

Underweight prevalence as per child gender is shown in Tables 11. The rate is 50.4 per cent which is one of the highest in Yemen with severe underweight of 18.9 per cent. An overall shift of the study population is shown in the graphs, reflecting the overall deviation of the study population from the reference population, implying the presence of widespread malnutrition. The statistical details of the underweight

prevalence are shown in the tables 11 below.

The above underweight rate exceeds the WHO (2000) critical levels of 30 per cent and above. It is worth noting that underweight is a composite variable for Global Acute Malnutrition and Chronic Malnutrition levels in a population.

	<i>All</i> <i>n = 635</i>	<i>Boys</i> <i>n = 327</i>	<i>Girls</i> <i>n = 308</i>
Prevalence of underweight (<-2 z-score)	(320) 50.4 % (46.4 - 54.3 95% CI)	(167) 51.1 % (45.5 - 56.6 95% CI)	(153) 49.7 % (44.0 - 55.4 95% CI)
Prevalence of moderate underweight (<-2 z-score and >=-3 z-score)	(200) 31.5 % (27.9 - 35.3 95% CI)	(105) 32.1 % (27.1 - 37.5 95% CI)	(95) 30.8 % (25.8 - 36.4 95% CI)
Prevalence of severe underweight (<-3 z-score)	(120) 18.9 % (16.0 - 22.2 95% CI)	(62) 19.0 % (14.9 - 23.7 95% CI)	(58) 18.8 % (14.7 - 23.7 95% CI)

Table 12: Summary of Malnutrition Rates

	<i>Mountainous</i>		
	<i>n</i>	<i>%</i>	<i>95% CI</i>
Global Acute Malnutrition (WHZ<-2 or oedema)	68	10.8	8.5 - 13.5
Severe Acute Malnutrition (WHZ<-3 or oedema)	9	1.4	0.7 - 2.8
Oedema	0	0	-
Global Acute Malnutrition (WHM<80% or oedema)*	38	6.0	4.3 - 8.2
Severe Acute Malnutrition (WHM<70% or oedema)*	6	0.9	0.4 - 2.1
Stunting rate (HAZ<-2 z score)	439	71.4	67.6 - 74.9
Severe stunting rate (HAZ <3 z score)	254	41.3	37.4 - 45.3
Underweight Rates (WAZ<-2 z score)	320	50.4	46.4 - 54.3
Underweight rate (WAZ_-3 z score)	120	18.9	16.0 - 22.2

* NCHS reference is used.

4.6: Mortality

The crude death rate is 0.13 per 10,000 per day. The rate is higher among males than females (0.16 and 0.09 respectively). The under-five death rate is 0.33 per 10,000 per day, respectively. These rates are low and within acceptable levels according to WHO categorisation, hence not raising concern. No death is caused by violence

	<i>U5</i>	<i>Total</i>

4.6.1: Population Pyramid

Information about household members during the previous 90 days was collected. The resulting population pyramid for each zone is shown here.

5.0 DISCUSSION AND VARIABLE ASSOCIATION

Levels of malnutrition in Rayme are somehow different than those reported by SMART surveys in Taiz and Hajja. GAM rate was found close to that of Taiz Mountains and Hajja Mountains but lower than those of Taiz Lowland and Hajja Lowland. SAM also was found lower than those seen in Hajja Lowland, Taiz Lowland and all Hodeidah zones. However, it is paradoxical issue since proxy GAM and proxy SAM as found by using MUAC cutoff points of 125 mm and 115 mm were higher than GAM and SAM found by WHZ Scores. This is the first time to report such pattern in Yemen⁸. The reason behind finding this pattern is rates of underweight and stunting as mentioned below.

High levels of underweight and stunting found in Rayma. Unless it may be existed in another governorate, Rayma is unique in having level of stunting exceeded 70 per cent with long interval of about 20 per cent between stunting and underweight. Table 14 below shows the differences between Rayma, Hajja and Taiz in underweight and stunting.

Table 14: comparison the underweight and stunting of Rayma with those of Taiz and Hajja

Survey	Underweight%		Stunting%	
	WAZ < 2	WAZ < 3	HAZ < 2	HAZ < 3
Taiz Mountains - Feb 2012	35	9.1	51.5	17.1
Taiz Plain and Coastal - Feb 2012	44.3	13.4	49.1	19.1
Hajja Mountains - May 2012	45.5	13.7	61.3	29.8
Hajja Lowland - May 2012	47	15.9	48.8	17.7
Rayma - May 2012	50.4	18.9	71.4	41.3

There is no doubt that having MUAC below 125 mm or below 115 mm means depletion or extremely depletion of muscles. It was found that most of those are wasted by MUAC who are severely stunted but moderately underweight were found of normal WHZ Scores. This is the reason of having higher proxy GAM and proxy SAM using MUAC cutoffs than GAM and SAM using WHZ Scores.

Having this proxy GAM and proxy SAM in Rayma with high prevalence of chronic malnutrition and low mortality rates indicates a chronic suffering from acute malnutrition and the possible reason of this is not sudden deterioration in WASH situation or disease outbreak but chronic food insecurity. Rayma was in the top food insecure governorates in the WFP-CFSS 2009 with proportion of food insecure population of 52.8 per cent. This rate was not significantly changed in 2011 CFSS (50.6 per cent)

Levels of stunting and underweight found in this survey are above the WHO 'critical' levels thresholds of 40 per cent and 30 per cent respectively. Level of GAM is found above the WHO 'serious' threshold of 10 per cent. However for deciding the proper GAM severity categorization level, proxy GAM or proxy SAM should be used guided by the categorization of UNFAO/Food Security and Nutrition Analysis Unit (FSNAU) which describe proxy GAM between 10 per cent and 14.9 per cent or proxy SAM above 1 per cent as 'critical'. Stunting rate in Rayma is extremely high and needs integrated response that should start now to reduce the prevalence and the resultant longer-term

⁸ Usually, it is known that prevalence of acute malnutrition reported by using MUAC cutoffs in Yemen is underestimated.

effect of stunting (children in Rayma will not reach their full potential in productivity and this is threatening the future of the development in this governorate). Findings of this surveys is are close to that found by the WFP-CFSS 2011 which are 8.9 per cent wasting, 45.2 per cent underweight and 68.4 per cent stunting.

As found by surveys done in other governorates no differences between girls and boys in the prevalence of underweight and stunting were found, however, unlike other surveys, there statistical difference in GAM was found between girls and boys in Rayma.

5.1: Child Feeding, Vitamin A Supplementation and Malnutrition Levels

Among children aged 6 to 24 months, there is statistically significant difference in stunting and underweight between those still breastfed and those have ceased breastfeeding. Absence of stunting was noted higher among those still breastfed (X^2 : 4.1, $P < 0.05$, df 1) while underweight was noted higher among those have ceased breastfeeding (X^2 : 3.5, $P < 0.05$, df 1). The number of feeds (other than breastfeeds) and milk feeds (other than breastmilk) show no effect on levels of stunting, underweight and wasting.

It is notable that the vitamin A coverage (supplementation 6 months prior to the survey) was lower than the recommended 95 per cent coverage (Sphere Standards, 2011). It was not found any positive effect of vitamin A supplementation on levels of either stunting, underweight or wasting.

5.2: Morbidity and Malnutrition Levels

The disease prevalence was recorded as being high in Rayma Governorate with levels of 48.1 per cent diarrhoea, 43.6 per cent ARI and 54.8 per cent fever. There is statistical significant effect was observed for diarrhoea two weeks prior to the survey on the prevalence of GAM (X^2 : 6.1, $P < 0.01$, df 1) and SAM (X^2 : 6.2, $P < 0.05$, df 1). There is effect was also seen for fever on SAM prevalence (X^2 : 4.2, $P < 0.05$, df 1). High morbidity levels among stunted and muscle depleted children is increasing the disease severity and will reduce the chance for these children to gain height and build muscles and put them at the edge of death risk.

5.3: Household Caretaker Education and Nutrition Situation

The association between mother education and child nutritional status is well reported. In this survey, levels of underweight were found inversely proportional with the education level of household caretaker (X^2 : 10.7, $P < 0.05$, df 4). No association was reported between wasting or stunting and education level.

5.4: WASH and Nutrition Situation

GAM was found statistically higher among those with unclean storage containers of drinking water (X^2 : 4.5, $P < 0.05$, df 1). Latrine type was also seen to have some effect. Flush or pour flush latrines were found to have association with lower rates of stunting (X^2 : 8.7, $P < 0.05$, df 3).

The household caretaker hand washing with water and soap practice showed some correlation with malnutrition levels. Although those with underweight were equally distributed among those mentioned and not mentioned washing hand with soap after toilet, non-underweight level were seen higher among the group mentioned washing hand after toilet than those have not mentioned (X²: 3.5, P<0.05, df 1). However, hand washing with soap after toilet was noted with lower levels of severe underweight (X²: 12.3, P<0.001, df 1). Low proportion of GAM were noted among children in households where caretakers reported practicing hand-washing after using latrine (X²: 5.0, P<0.05, df 1). Practicing the hand washing before meal by household caretaker was found associated with lower levels of severe stunting (X²: 4.7, P<0.05, df 1), lower levels of underweight (X²: 7.6, P<0.01, df 1), severe underweight (X²: 16.5, P<0.0001, df 1), and lower levels of GAM (X²: 8.4, P<0.01, df 1). The caretaker hand washing after meal was also noted to have association with malnutrition levels. It was found associated with lower levels of severe stunting (X²: 3.6, P<0.05, df 1), lower levels of underweight (X²: 8.5, P<0.01, df 1), severe underweight (X²: 5.4, P<0.05, df 1), and lower levels of GAM (X²: 4.1, P<0.05, df 1). Household hand washing with before cooking was found associated with lower levels of underweight (X²: 13.1, P<0.001, df 1), lower levels of severe underweight (X²: 8.9, P<0.01, df 1), and lower levels of GAM (X²: 10.5, P<0.001, df 1). It seems that existence of appropriate community based WASH facilities and practices can help to reduce the high levels of chronic malnutrition in Rayma Governorate.

6.0 RECOMMENDATIONS

Although the prevalence of acute malnutrition looks better than that in many other areas in the coastal areas of Yemen, the proxy indicators of the acute malnutrition indicated serious problem in this governorate.

However with high rates of stunting and underweight, it is likely to have high incidence rates if the intervention approach focuses on acute malnutrition only. In such situation intervention package should focus underweight installing the growth monitoring and promotion approach and using the growth monitoring chart. Children with SAM should be treated first at the facility that provides the CMAM service. It is also important to note that there are pockets of vulnerability that can be compared to the level found in many lowland areas in Yemen.

The presence of multiple aggravating factors including poor feeding practices, diseases, insufficient coverage of essential services such as immunization and micronutrient supplementation, and low education for the majority of caretakers, indicate a need for delivery of a package of interventions that not only address the critical wasting but mainly to address underweight and chronic malnutrition. Delivery of intervention services catering for both mothers and children, especially during the window of opportunity (from conception till the child is 2 years and beyond). WASH interventions especially promoting of the handwashing is essential to have sustained improvement in nutritional and health status.

Some of the immediate and medium-term interventions proposed include:

Immediate Interventions

- The priority is cleaning the pockets from acute malnourished by mobilizing outreach clinics and to refer the complicated cases to nearest TFCs. Outreach clinics should also provide treatment services for child illnesses especially diarrhoea and ARI.

Medium and Long Term Interventions

- Rayma is in need of a programme that deals with underweight and chronic malnutrition. This should include utilization the approach of Growth Monitoring and Promotion (GMP), maternal nutrition package, and promotion of hygienic. Pregnant women, lactating mothers, and underweight children should be supported by rations cereal: legume mix (locally known *Shabiza*) with sachets of micronutrients sprinkles in monthly basis.
- Food security enhancement projects are also required for Rayma, since this governorate is suffering from chronic food insecurity that can be seen from the high level of stunting, high levels of proxy GAM and from the high insecurity prevalence as mentioned earlier and average maternal MUAC as shown by the WFP - CFSS 2011. Rayma is the lowest governorate of average maternal MUAC with value of 24.2 cm.

Other Recommendations

- Rayma is the first governorate that was found to have higher proxy GAM and SAM by MUAC cutoffs than standard GAM and SAM by WH Z-scores. However, there could be

other governorates with the same pattern that are suffering from chronic food insecurity, higher rates of stunting and underweight. For such cases, the international expertise is needed to setup intervention packages that are definitely beyond the idea of just having CMAM services.

Republic of Yemen
 Ministry of Public Health and Population
 Office of Public Health and Population, Rayma Governorate

Nutritional Status and Mortality Survey – Rayma Governorate – May 2012

Household Questionnaire (Form 1)

First: Explain to the residents of the household (adults) about the survey and inform them of the agency conducting the survey and survey staff (team members). Then request their verbal agreement to participate in the survey.

Consent	1.	Yes.		Go to the end.
	2.	No.		

Date of interview	Day	month	year				
		∅ 5	2 ∅ 1 2				

District	Ozla (Sub-district)	Village or neighborhood
name	Name	name

Name of head of household	
---------------------------	--

Survey team number		Name	Signature
	Household and anthropometric data		
	Mortality data		
	Team leader		

Indicate which situation applies:

1.	Absence of household upon first visit which necessitated a second visit	
2.	Absence of child upon first visit which necessitated a second visit *	

* If the child is not present, all data should be filled in except anthropometric measurements and edema which should be completed only if the child is present.

Note: The data inside the cover is for field and administrative use by the team members.

Questionnaire Number:

To be filled by the Team Leader (for data input purposes)

Repeated absence of the household even after the second visit (1=yes, 2=no)	
Consent (1=yes, 2=no)	

Team Number

Questionnaire Number:

Q001: Household data (only those who are alive and living together continuously)

H001a	Number of household members (only those who are alive and living with the household on the date of the survey)	Quantity	
		<input type="text"/>	

H001b	Number of children under five (only those who are alive and living with the household on the date of the survey)	Quantity	
		<input type="text"/>	

H001c	Number of children under six months (only those who are alive and living with the household on the date of the survey)	Quantity	
		<input type="text"/>	

Q002 – Q003: Head of household data

H002	Gender of the head of household		
	1.	Male	<input type="text"/>
	2.	Female	

H003	Social status of the head of household		
	1.	Married and living with partner	<input type="text"/>
	2.	Married and not living with partner for at least six months or more.	
	3.	Widow/widower	
	4.	Divorced	
	5.	Angered and separated	
	6.	Single	

Q004: Household caretaker data

H004	Education level of household caretaker		
	1.	Illiterate.	<input type="text"/>
	2.	Can read and write (literate).	
	3.	Basic education.	
	4.	Secondary education.	
	5.	Tertiary education (university, college, or institute).	

Q005: Household income source

H005	What is the primary source of income for the household?		
	1.	Sale of non-qat agricultural products	
	2.	Sale of livestock and livestock products	
	3.	Sale of seafood	
	4.	Trading	
	5.	Temporary work (Casual work)	
	6.	Job with fixed monthly salary	
	7.	Remittance (from emigrants)	
	8.	Craftsmanship	
	9.	Farming/sale/transport of qat	
	10.	Donation (from friends and relatives)	
	11.	Social insurance	
12.	Other: specify -		

Q006 – Q012: Water, environmental sanitation, and hygiene data

H006	What is the main source of drinking water in your home? (choose one only)		
	1.	Piped water connected to home.	
	2.	Piped water connected to yard.	
	3.	Open, unprotected well.	
	4.	Open, protected well.	
	5.	Covered rainwater collection tank.	
	6.	Open rainwater collection tank.	
	7.	Water delivery truck. (water tanker)	
	8.	Bottled water (Hadda, Shamlan, Kawthar, etc.)	
	9.	Unprotected surface water (valley, running spring, etc.)	
	10.	Protected spring water.	
11.	Other: specify -		

H007a	Do you treat the water before drinking?		Go to
	1.	Yes	
	2.	No	→ H008
	3.	Don't know.	→ H008

H007b	What is the <u>main</u> method used to treat <u>drinking water</u> ? Choose only one.		
	1.	Boil water before drinking.	
	2.	Use chlorine or Clorox.	
	3.	Filter through clean cloth.	
	4.	Use ceramic or sand filter or similar filter method.	
	5.	Let water settle before drinking.	
	6.	Use of alum crystal to disinfect.	
	7.	Other.	

H008	Note: <u>Investigate</u> availability of storage for <u>drinking water</u> . Is the water container clean (no algae seen)?		
	1.	Yes.	
	2.	No.	

H009	What is used for defecation? Choose one of the following. <u>Verify</u> existence of facilities and practices.		
	1.	Toilet – equipped with flush mechanism to wash water down.	
	2.	Toilet – uncovered pit.	
	3.	Toilet – simple dry covered pit.	
	4.	Outdoors in the open air (in fields, for example).	
	5.	Other: specify -	

H010	When do you clean your hands with soap, ashes, dust, tree leaves, or any other material? Place a check mark in more than one answer if the respondent mentions them. Do not give the person any choices before the answer.				
	a.	After using the toilet.	1.	Yes	
			2.	No	
	b.	Before eating.	1.	Yes	
			2.	No	
	c.	After eating.	1.	Yes	
			2.	No	
	d.	Before cooking.	1.	Yes	
			2.	No	
	e.	Before feeding the child.	1.	Yes	
2.			No		
f.	After disposing of child's waste.	1.	Yes		
		2.	No		
g.	After cleaning the livestock or poultry areas.	1.	Yes		
		2.	No		
h.	Any other answers: Specify -				

H011	Note: With regard to hand-washing, confirm the use of the following:				
	a.	Water.	1.	Yes	
			2.	No	
	b.	Soap.	1.	Yes	
			2.	No	
	c.	Ashes, dust, limestone powder, tree leaves.	1.	Yes	
2.			No		

H012a	Where do you obtain health care if someone in the household gets sick?			Go to
	1.	No medical help is sought.		
	2.	Personal medicines.		
	3.	Traditional healer.		
	4.	Shaykh.		
	5.	Pharmacy.		
	6.	Private clinic.		→ C013
	7.	Public health facility.		→ C013

Questionnaire Number:

H012b	Why don't you seek health services at a health facility or clinic when someone gets sick?		
	1.	High cost.	
	2.	Facility is distant and transportation is not available.	
	3.	Not enough time.	
	4.	We do not have confidence in the nearby services.	
	5.	Other: specify -	

Q013 – Q019 : Nutritional and Immunization Status of Children ages 6-59 months within the household

Questionnaire Number:

	C013	C014a	C014b	C015	C016a	
Child no.	Child's first name	Child's gender 1 = male 2 = female	Date of birth. If the date is recorded, skip C014b)	Age of child in months. If the child is older than 24 months, go to question C017.	For children 24 months or less. Is the child still breastfeeding? 1 = yes 2 = no	For children 24 months or less. How many times have you fed the child in the past 24 hours? Do not include number of times breastfed.

Annex 2: Rayma Mortality Survey Questionnaire

رقم إستبيان الأسرة:

مسح الحالة التغذوية والوفيات في محافظة ريمة – مايو 2012

استمارة رصد أفراد الأسرة خلال فترة 90 يوم من تاريخ المسح (نموذج 2)

مديرية المسح: _____ القرية/ الحي: _____ التاريخ: _____ رقم العنقود: _____

رقم الفريق: _____ رقم إستبيان الأسرة: _____ طبقة المسح: _____

م	الاسم (اختياري)	الجنس (ذكر أو أنثى)	العمر بالسنوات	التحق أثناء فترة 90 يوم	غادر أثناء فترة 90 يوم	ولد أثناء فترة 90 يوم	توفي أثناء فترة 90 يوم	سبب الوفاة	موقع الوفاة

20									

هام: يتم تسجيل كل الأفراد الموجودين حالياً و كل من التحق بالأسرة أو غادرها أو توفي أو ولد خلال 90 يوم من تاريخ المسح

رموز أسباب الوفاة	
1 = الإسهال	5 = سوء التغذية
2 = الحمى	6 = العنف / بسبب الصراعات
3 = الحصبة	7 = أخرى (حدد)
4 = مشاكل في التنفس	
رموز مواقع الوفاة	
1 = في الموقع الحال	
2 = أثناء الهجرة	
3 = في آخر مكان سكن فيه	
4 = أخرى (حدد)	

Family Reference Number:

Nutritional Status and Mortality – Rayma Governorate, May 2012

Individual household members monitoring form for the 90 days following survey commencement date (Form 2)

District surveyed: _____ Village/neighborhood: _____ Date: _____ Cluster number: _____

Team number: _____ Household questionnaire number: _____ Survey zone (stratum): _____

No.	Name (optional)	Sex (M, F)	Age in years or date of birth	Joined within the 90 day period	Left within the 90 day period	Born within the 90 day period	Died within the 90 day period	Cause of death	Place of death

Important: All individuals present in the household should be recorded, whether joining or leaving the household, and whether born or died within the 90 day period from commencement of the survey.

Symbols for causes of death	
1 = diarrheal disease	5 = malnutrition
2 = fever	6 = violence / impacts of conflicts
3 = measles	7 = other (specify)
4 = respiration disorders	

Symbols for places of death
1 = at the current location
2 = during emigration
3 = at a different residence
4 = other (specify)

Annex 4: Rayma Nutrition Survey Standardization Test Report for Evaluation of Enumerators

Weight:

	Precision: Sum of Square [W2-W1]	Accuracy: Sum of Square [Superv.(W1+W2)- Enum.(W1+W2)]	No. +/- Precision	No. +/- Accuracy
Supervisor	0.03		1/2	
Enumerator 1	0.02 OK	0.13 POOR	2/0	0/7
Enumerator 2 ⁹	97.92 POOR	97.77 POOR	3/3	1/5
Enumerator 3 ¹⁰	8.83 POOR	9.66 POOR	3/2	1/4
Enumerator 4	0.15 POOR	0.12 POOR	4/5	2/4
Enumerator 5	0.17 POOR	0.10 POOR	6/3	2/5
Enumerator 6	0.40 POOR	0.65 POOR	6/1	5/3

Height:

	Precision: Sum of Square [H2-H1]	Accuracy: Sum of Square [Superv.(H1+H2)- Enum.(H1+H2)]	No. +/- Precision	No. +/- Accuracy
Supervisor	0.45		3/6	
Enumerator 1	0.96 POOR	0.71 OK	0/6	3/6
Enumerator 2	3.10 POOR	2.87 POOR	1/7	5/5
Enumerator 3	3.25 POOR	4.20 POOR	8/1	6/3
Enumerator 4 ¹¹	20.59 POOR	24.02 POOR	6/2	9/0
Enumerator 5	2.90 POOR	4.57 POOR	5/4	1/9
Enumerator 6	4.80 POOR	2.93 POOR	5/4	4/6

MUAC:

	Precision: Sum of Square [MUAC2-MUAC1]	Accuracy: Sum of Square [Superv.(MUAC1+MUAC2)- Enum.(MUAC1+MUAC2)]	No. +/- Precision	No. +/- Accuracy
Supervisor	9.00		3/3	
Enumerator 1	270.00 POOR	427.00 POOR	4/0	5/5
Enumerator 2 ¹²	Error	Error	6/2	2/8
Enumerator 3	156.00 POOR	259.00 POOR	3/7	6/4

⁹ Mistakes in reading/writing weights of three children.

¹⁰ Mistakes in writing weight readings of two children. '9' was written as '4', and '5' was written as '2'

¹¹ One child was measured as 104 cm in the first height reading and 99.4 cm in the second reading.

¹² MUAC of one child was written 14.3 cm in the first reading and 70.8 cm in the second reading

Enumerator 4	138.00 POOR	337.00 POOR	3/4	0/10
Enumerator 5	46.00 POOR	123.00 POOR	6/3	5/3
Enumerator 6	124.00 POOR	167.00 POOR	6/2	5/3

For evaluating the enumerators the precision and the accuracy of their measurements is calculated. For precision the sum of the square of the differences for the double measurements is calculated. This value should be less than two times the precision value of the supervisor. For the accuracy the sum of the square of the differences between the enumerator values (weight1+weight2) and the supervisor values (weight1+weight2) is calculated. This value should be less than three times the precision value of the supervisor. To check for systematic errors of the enumerators the number of positive and negative deviations can be used.

Annex 5: Reference Table for Age Estimation

Nutrition Survey - Rayma Gouvernoarte May 2012

الطريقة التقريبية لحساب العمر بالاشهر مبني على اليوم الأول من المسح
يجب حساب يوم إضافية عن كل يوم من المسح بدء من اليوم الثاني

مواليد العام 2010

مواليد العام 2007

Annex 9: Job Descriptions for Survey Teams (Extracted from SMART Training Materials)

Each survey team should be composed of at least 3 people. Including women in survey teams is highly recommended since they are usually more comfortable interacting with children. Generally, two surveyors are involved in anthropometric measurements while another one, the team leader, records the data on the forms. However, it is strongly suggested that each team member knows how to accomplish the tasks of his teammates, because unexpected events can happen and a change in the staff may be required.

All team members must have the following qualifications:

- They should be able to write and read English or French (depending on the country where the survey takes place) and speak the local languages of the areas where the survey will be conducted.
- They should have sufficient level of education, as they will need to read and write fluently and count accurately.
- They should be physically fit to walk long distances and carry the measuring equipment.
- They do not (necessarily) have to be health professionals. In fact, anyone from the community can be selected and trained as long as he meets the above criteria.

1. Survey Manager (or supervisor)

The manager guarantees the respect of the survey methodology; he has the responsibility for:

- 1- Gathering available information on the context and survey planning,
- 2- Selecting team members,
- 3- Training team members,
- 4- Supervision of the survey: Taking necessary actions to enhance the accuracy of data collected:
 - 4.1 Visiting teams in the field and making sure that before leaving the field, each team leader reviews and signs all forms to ensure that no pieces of data have been left out; making sure that the team returns to visit the absent people in the household at least once before leaving the area.
 - 4.2 It is particularly important to check cases of oedema, as there are often no cases of oedema seen during the training and some team members may therefore be prone to mistaking a fat child for one with oedema (particularly with younger children). The supervisor should note teams that report a lot of oedema, confirm measles and death cases, and visit some of these children to verify their status.

- 4.3 Ensuring that households are selected properly and, that the equipment is checked and calibrated each morning during the survey, and that measurements are taken and recorded accurately.
- 4.4 Deciding on how to overcome the problems encountered during the survey. Each problem encountered and decision made must be promptly recorded and included in the final report, if this has caused a change in the planned methodology.
- 4.5 Organizing data entry into ENA and checking any suspect data every evening, by using the appropriate sections of the plausibility report.
- 4.6 Organizing an evening “wrap up” session with all the teams together to discuss any problems that have arisen during the day¹³.
- 4.7 Ensuring that the teams have enough time to take appropriate rest periods and has refreshments with them. It is very important not to overwork survey teams since there is a lot of walking involved in carrying out a survey, and when people are tired, they may make mistakes or fail to include more distant houses selected for the survey.

5- Analyse and write the report.

2. Team Leader

Skills and required abilities:

To be able to read, write and count; know the area to survey; be reliable and friendly.

Tasks:

1. Ensures all forms and questionnaires are ready at start of day;
2. Ensures all equipment is ready at start of day;
3. Calibrates measurement instruments on daily basis;
4. Ensures all food/refreshments are ready at start of day;
5. Organises briefing meeting with his team before departure in morning;
6. Speaks with chief of village to explain the survey and its objectives,
7. Draws a map of the area to survey and use a random table;
8. Manages the households selection procedure;
9. Uses a local events calendar to estimate the age;
10. Calculates the Weight-for-Height ratio after taking anthropometric measurements;
11. Checks if the child is malnourished (checks for the presence of oedema);
12. Fills the anthropometric form;
13. Fills survey questionnaires when needed;

¹³ This may not be possible if the survey area is large since the teams might be widely separated and remain in the field for several days. In that case, communication with teams in the field might often be very difficult; hence, each team leader must be sufficiently trained to be able to take decisions independently.

14. Fills the referral form if necessary;
15. Ensures that houses with missing data are revisited before leaving the field the same day;
16. Checks that all forms are properly filled out before leaving the field.
17. Ensures that all the equipment is maintained in a good state;
18. Manages time allocated to measurements, breaks and lunch,
19. Ensures security of team members,
20. Note and report the problems encountered.

3. Measurers

Skills and required abilities:

To be able to read, write and count; know the area to survey; be reliable and friendly.

Tasks:

1. Measures the height, weight and arm circumference (if included in the survey);
2. Assesses the presence of edema;
3. Uses a local events calendar to estimate the age;
4. Respects the time required for measurements, breaks and meals;
5. Takes care of the equipment;
6. Follows security measures.

The measurers must acquire some special skills and knowledge although they don't have the primary responsibility for tasks that are related:

1. Know how to calculate the weight-for-height ratio;
2. Know how to select households for the survey;
3. Know how to check if a child is malnourished;
4. Learn how to make a reference for a malnourished child.

Annex 10: Referral Form for the Malnourished Children

مسح الحالة التغذوية للأطفال تحت سن الخامسة في محافظة ريمة، مايو 2012
